

ABSTRACT

The connector housing 30 is formed with a pair of guide grooves 50a, 50b and a pair of side walls 60.

5 The guide grooves 50a, 50b support the both side edges of the upper body portion 21 of the thick first card 20 and also the both side edges of the card body 11 of the thin second card 10 and guide these cards as they are inserted or extracted. The side walls 60 define,

10 below a space between the paired guide grooves 50a, 50b, a space in which to accommodate the lower body portion 23 of the first card 20. This construction ensures that, whichever of the first and second cards is inserted, the elastic displacements of the contact

15 terminals 40 of a card connector 1 remain the same, allowing the card to be electrically connected stably.
